

Rendezvous App

by Katerina Zorko

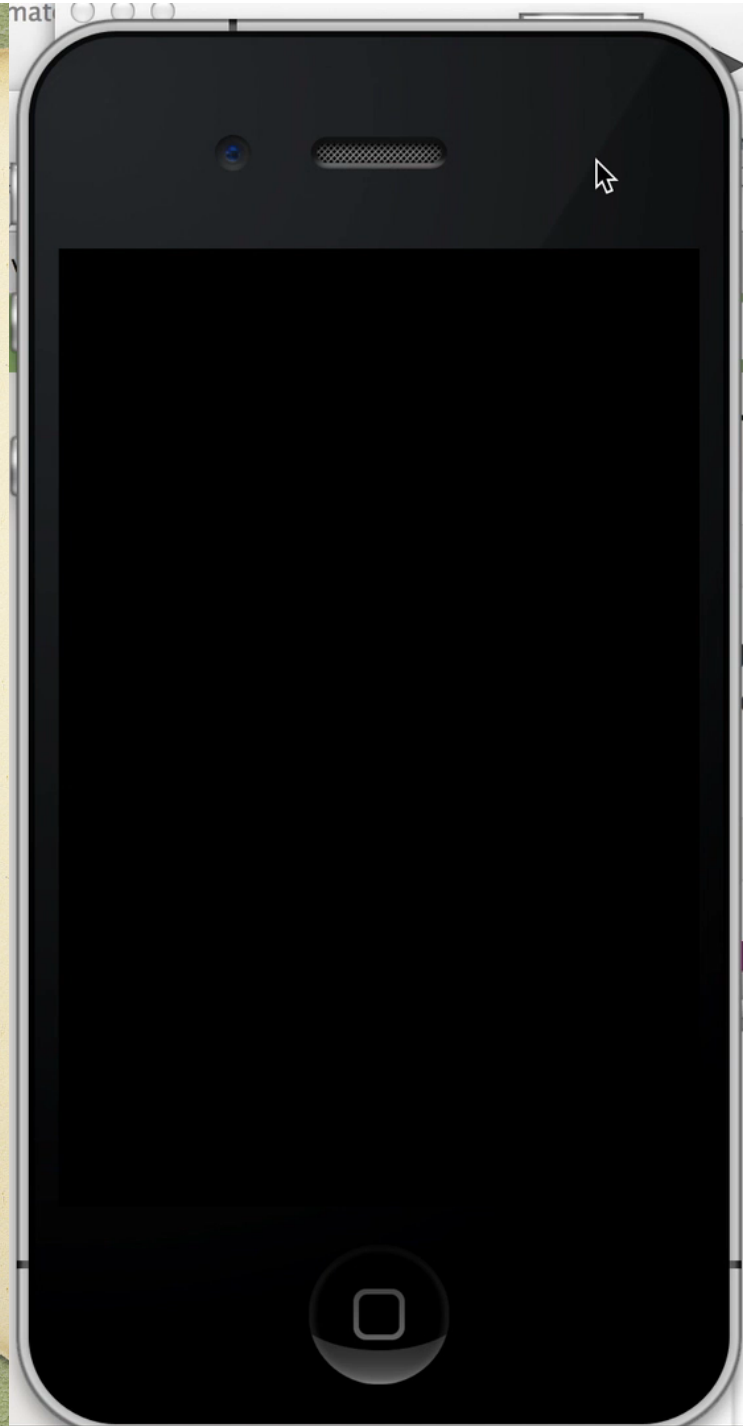

University of Queensland

Week One June 2, 2014

Proposed Work

- I will be working on creating an app that will allow users to easily meet up with each other and securely share their location.
- Rendezvous will have a map that will display each of the friends' locations and the distance to the destination.
- If the user selects a location at UQ, the app will suggest nearby locations at UQ and will also provide a link to the UQNav app where the user can view the proposed meeting location.

Future Goals

- Next week I hope to work on the New Event screen more to allow names of contacts to be autocompleted.
- I also want to use Google API to allow the user to select a meeting location that will be recognized with google maps.
- I also want the user to be able to pick the meeting time.
- Finally if I am able to finish the New Event screen, I want to begin working on the settings screen.
